## 1. Introduction

Natural Forces has undertaken a noise impact assessment for the proposed 10 turbine Burchill Wind Project site to assess the impact of the sound emissions on the dwellings, seasonal homes, and local businesses surrounding the project. A map of the project area with the proposed wind turbine generator (WTG) layout is included in Appendix A.

The noise assessment was conducted using the ISO 9613-2: Acoustics – Attenuation of sound during propagation outdoors – Part 2: General method of calculation model within the Decibel module of the software package, windPRO version 3.1.

### 1.1. Noise guidelines

New Brunswick has set recommended sound criteria for wind turbines in the *Additional Information Requirements for Wind Turbines* document created to outline additional requirements to the *Environmental Impact Assessment Regulation*. The recommendations are outlined in Table 1. These sound criteria have been used for this assessment.

Table 1: Recommended Sound Criteria for Wind Turbines (*Additional Information Requirements for Wind Turbines*).

Wind Speed (m/s)	4	5	6	7	8	9	10	11
Wind Turbine Noise Criteria [dB(A)]	40	40	40	43	45	49	51	53

### 1.2. Receptors

There are 510 receptors located within 3.5 km of the turbine locations that consist of year-long dwellings, seasonal dwellings, and local businesses. They have been identified based on online geographical data from the Data Catalogue available on the Service New Brunswick website and cross referenced with aerial photography, as well as site visits. The geographical coordinates of these receptors are included in Appendix B. A map of the project area with the receptors is included in Appendix A.

### 1.3. Turbine Model

The turbine model used for the assessment is the Enercon E-141 EP4, a 4.2 MW machine. This turbine model has a hub height of 135 m and a rotor diameter of 141 m. The geographical coordinates of the 10 proposed turbines are included in Appendix B. There are no existing or proposed wind farms within 10 kilometers of the project; therefore, it is unlikely any cumulative WTG noise effects will occur external to the project.

Should the turbine model change, a new noise assessment will be conducted.

## 2. Noise Impact Assessment Methodology

The sound pressure level was calculated at each point of reception using the Decibel module of WindPRO v.3.1, which uses the ISO 9613-2 model “Attenuation of sound during propagation outdoors, Part 2: A general method of calculation”. The calculations were performed using the Enercon E-141 EP4, 4.2 MW wind turbine generators with a hub height of 135 m.

## 2.1. Worst Case Noise Assessment

The worst case noise assessment followed a conservative methodology in calculating noise levels by assuming downwind propagation is occurring simultaneously in all directions of the wind turbine. In reality, noise propagation in an upwind direction would result in a significant reduction of noise levels at any receptor located upwind from the turbine. This means that the resulting sound levels from the assessment are likely calculated as higher than they would be experienced.

As another conservative measure, no attenuation was considered from topographical shielding for objects (such as barns, trees, buildings, etc.) located between the turbines and receptors. A global ground attenuation of 0 was input, which represents a ground area that is covered in glass, to produce the worst-case scenario for noise impacts.

No correction for special audible characteristics, such as clearly audible tones, impulses, or modulation of sound levels, was made as part of this assessment. These are not common characteristics of modern WTGs in a well-designed wind farm. It is common that WTG manufacturers guarantee the absence of tonal noise produced by the WTG. Furthermore, impulses and modulation of sound levels from the wind farm under normal conditions would not be of a level to necessitate the application of any penalty.

## 2.2. Realistic Case Noise Assessment

The realistic case noise assessment largely follows the same methodology as the worst case assessment but includes modeling of the local ground cover. Within the ISO 9613-2 General model, the Ground Attenuation parameter was changed to Alternative. This option is described as using “the orographic shape of the terrain to assess the ground attenuation by calculating the average vertical distance line-of-sight between receptor and hub of the turbine and the terrain between the two points.” In this way, a valley between the two points will cause a low attenuation whereas a hill will cause a high attenuation.

## 3. Results of Noise Impact Assessment

The results of the worst case noise prediction model for the receptors that are predicted to receive the highest sound levels are summarized in Table 2. The full results from windPRO are included in Appendix B. Table 2 demonstrates that there are two receptors that experience a maximum sound level of over 40 dB(A) from the proposed wind farm in the worst case scenario model. These two receptors are local businesses within the Spruce Lake Industrial Park. When the realistic case noise assessment was conducted, only one receptor exceeded the guidelines.

The worst case sound levels at all the remaining 508 receptors are in compliance with the *Additional Information Requirements for Wind Turbines* document created to outline additional requirements to the *Environmental Impact Assessment Regulation* specifically for wind turbines. Table 2 shows the maximum modeled sound levels that are predicted to be experienced at each receptor for any wind speed from 4.0 m/s to 12.0 m/s.

More detailed results for the two receptors that exceed the worst case sound levels receptors (receptors E and F) are included in Table 3. Under the worst case assessment scenario, these results demonstrate that the requirements are only slightly exceeded at a wind speed of 5.0 m/s for receptor E. Again in the

worst case assessment scenario, the requirements at receptor F are only slightly exceeded at wind speeds of 5.0, 6.0, and 7.0 m/s. Under the realistic case noise assessment, the exceedance is reduced to wind speeds of 5.0 and 6.0 m/s for receptor F. The highest worst case scenario exceedance of the requirements is experienced by receptor F, which amounts to 3.1 dB(A) over the requirement at 6.0 m/s wind speeds.

Table 2: Wind turbine noise impact assessment summary of the 22 receptors predicted to receive the highest impact for any wind speed modelled between and including 4 to 12 m/s.

Receptor ID	Worst Case Max Sound Level from WTG [dB(A)]	Realistic Case Max Sound Level from WTG [dB(A)]	Compliance with New Brunswick's Requirements (under worst case assessment)	Compliance with New Brunswick's Requirements (under realistic case assessment)

#### 4. Discussion

The receptors exceeding the requirements under worst case conditions are two buildings in the Spruce Lake Industrial Park. These buildings are owned by Simpson Truck & Tractor Parts (receptor E), a heavy equipment parts supplier and steel distributor, and GFL Environmental (receptor F), a waste management company. The GFL Environmental building is a warehouse-style building. The Simpson Truck & Tractor Parts building is an office/warehouse style building. Photos of these buildings are included in Figure 1 and Figure 2. Both of these businesses will be engaged to assess how these buildings are used, any sound level concerns, and mitigation strategies, if necessary.

In addition to other industrial land uses nearby and heavy equipment traffic in the area, there is an asphalt plant and operating pit adjacent to these buildings. Because of the industrial nature of the area, the sound levels are naturally quite high, which is predicted to result in the noise levels from the WTGs to be negligible.

Figure 1: The Simpson Truck and Tractor Parts building (receptor E).

Figure 2: The GFL Environmental building (receptor F).

## 5. Conclusions and Recommendations

Natural Forces has completed worst case and realistic noise assessments to evaluate the noise impact of the proposed Burchill Wind Project on the identified receptors located within 3.5 km of the proposed WTG locations.

Based on the parameters used to run the windPRO noise prediction model, it has been shown that in the worst case scenario the predicted sound pressure levels emitted by the proposed WTG model in the 10-turbine layout are less than 40 dB(A) at the majority of the nearby receptors, including all of the residential dwellings. There are two industrial buildings that experience maximum sound pressure levels above 40 dB(A) in the worst case scenario. In the more realistic scenario, only one of the industrial buildings is modeled to experience sound pressure levels above 40 dB(A).

Given the industrial nature of these two buildings and the surrounding land uses, it is not expected that sound levels from the WTGs will be of concern. Regardless, these two businesses will be engaged to assess impact.

Aside from these two industrial buildings, this assessment demonstrates compliance with the *Additional Information Requirements for Wind Turbines* document created to support the New Brunswick *Environmental Impact Assessment Regulation*, most notably for all residential buildings in the area.

Worst Case**

## DECIBEL - Main Result

Calculation: Noise: Worst Case - Burchill 10Tc - E-141 (4.2 MW, 135 m HH)

Noise calculation model:

ISO 9613-2 General

Wind speed:

4.0 m/s - 12.0 m/s, step 1.0 m/s

Ground attenuation:

None

Meteorological coefficient, CO:

0.0 dB

Type of demand in calculation:

1: WTG noise is compared to demand (DK, DE, SE, NL etc.)

Noise values in calculation:

All noise values are mean values (Lwa) (Normal)

Pure tones:

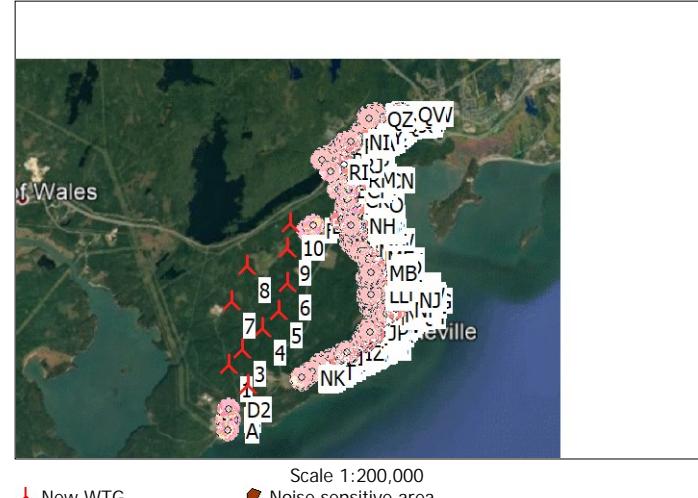

Fixed penalty added to source noise of WTGs with pure tones: 0.0 dB(A)

Height above ground level, when no value in NSA object:

4.5 m Don't allow override of model height with height from NSA object

Deviation from "official" noise demands. Negative is more restrictive, positive is less restrictive.:.

0.0 dB(A)

## **APPENDIX C:**

**WindPRO v3.1, Decibel Module Calculation Results:  
Realistic Case**

## DECIBEL - Main Result

Calculation: Noise: Realistic Case - Burchill 10Tc - E-141 (4.2 MW, 135 m HH)

Noise calculation model:

ISO 9613-2 General

Wind speed:

4.0 m/s - 12.0 m/s, step 1.0 m/s

Ground attenuation:

Alternative

Meteorological coefficient, CO:

0.0 dB

Type of demand in calculation:

1: WTG noise is compared to demand (DK, DE, SE, NL etc.)

Noise values in calculation:

All noise values are mean values (Lwa) (Normal)

Pure tones:

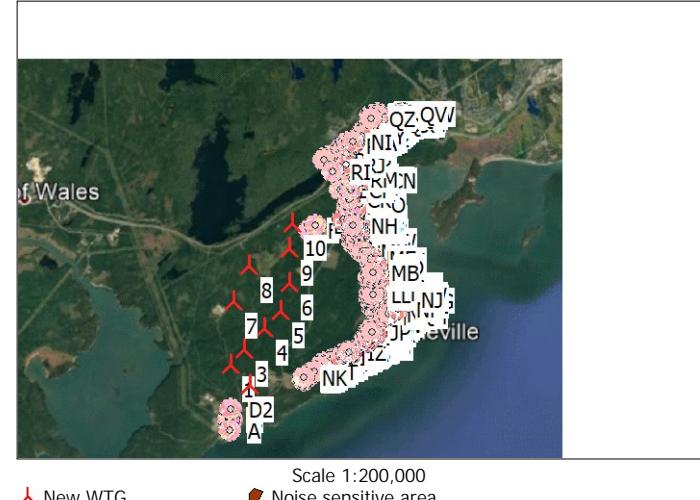

Fixed penalty added to source noise of WTGs with pure tones: 0.0 dB(A)

Height above ground level, when no value in NSA object:

4.5 m Don't allow override of model height with height from NSA object

Deviation from "official" noise demands. Negative is more restrictive, positive is less restrictive.:.

0.0 dB(A)

## WTGs

Easting	Northing	Z	Row data/Description	WTG type			Power, rated	Rotor diameter	Hub height	Noise data			First wind speed [m/s]	LwaRef [dB(A)]	Last wind speed [m/s]	LwaRef [dB(A)]	Pure tones
